BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

The method involves the identification of peptide sequences capable of binding to an HLA (human leukocyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide and MHC (major histocompatability complex) class I molecule is measured on intact human be used to select peptide epitopes for generating vaccines against a disease associated with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral immune responses. Peptide AAW39561 is a conserved hepatitis C virus type I NS4 derived peptide used to determine the stability of HLA-A*0201 complexed with known CTL lymphocytes.
from the core, E1, E2/NS1, NS2, NS3, NS4 or NS5 regions. The peptides were tested for peptide specific cytotoxic T-cell activity. The peptides AAR8470-77 were found to have substantial homology with a T-cell epitope and are useful in vaccines against HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           T cell epitope; immune response; human leukocyte antigen; HLA Class I; vaccine; immunogenic; major histocompatablilty complex; MHC; B cell; disease; anti-tumour; anti-viral.

The present invention describes a method of inducing and/or sustaining an immunological cytotoxic T lymphocyte (CTL) response in a mammal. The method comprises: (a) delivering an antigen to the mammal at a level to induce an immunological CTL response in the mammal; and (b) maintaining the level of the antigen in the mammal's lymphatic system to maintain the immunologic CTL response. The method can be used for the delivery of e.g. a differentiation antigen, a tumour-specific multilineage antigen, an embryonic antigen, an oncogene antigen, a mutated tumour-suppressor gene antigen, or a viral antigen. They can be used for the treatment of disease such as cancer, e.g. malignant melanoma or infectious disease, e.g. viral disease such as hepatitis or AIDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes place in the milleu of the lymphoid organ, and it sustains stimulation that is necessary to keep CTL active, cytotoxic and recirculating through the body, AMY10071 to AMY10639 represent examples of peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method of inducing and/or sustaining an immunological cytotoxic T lymphocyte (CTL) response in a mammal. The method comprises: (a) delivering an antigen to the mammal; at a level to induce an immunological CTL response in the mammal; and (b) maintaining the level of the antigen in the mammal. Jymphatic system to maintain the immunologic CTL response. The method can be used for the delivery of e.g. a differentiation antigen, a tumour-specific multilineage antigen, an embryonic antigen, an oncogene antigen, a mutated tumour-suppressor gene antigen, or a viral antigen. They can be used for the treatment of disease such as cancer, e.g. mallignant melanoma or infectious diseases, e.g. viral disease such as hepaticis or AIDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes that is necessary to keep CTL active, cytotoxic and recirculating through the body. AAX10071 to AAX10039 represent examples of peptide antigens given in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present sequence is an antigenic peptide derived from Hepatitis c virus, which was used in the present invention. The composition is useful in manufacturing

It is the putative sequence encoded in the open reading frame of hepatitis C virus (HCV) cDNA insert in clone 81. It is an epitope, portions of which could be used as immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV infection/non-A, non-B hepatitis.
                                                                                                                                                                                                                                                       Sequence of the polypeptide encoded in the hepatitis C virus (HCV) cDNA insert in clone 81.

                                                                                                                                                                                                                                                                                                                                           ;
                                                                                                                                                                   The present invention relates to a pharmaceutical composition comprising (a) an antigen; (b) an immunostimulating substance consisting of neuroactive compounds, hormones, compounds having growth hormone activity or their mixtures; and (c) a polycationic polymer. The present sequence is an antigenic peptide derived from Hepatitis c virus, which was used in the present invention. The composition is useful in manufacturing
                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hepatitis C virus gene - used for prodn. of polynucleotide probes, polypeptide(s) and antibodies for diagnosis, prevention and treatment of infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence is the peptide encoded by the hepatitis C virus (FKV) CDNA insert in DNA B1 (see AAN90305). The polypeptides are used to diagnose HCV-induced NANBH, to raise antibodies for immunoassay or treatment, or to produce vaccines.
                                                                                         New pharmaceutical composition comprising an antigen, an immunostimulating substance and a polycationic polymer, useful in

The polypeptide may be prepared by solid phase synthesis fragment coupling (pref.) or using recombinant technology. The assay has increased sensitivity and is more specific than assays using the polypeptide C100-3 (EP-318216). See also AAQ13146-48 and AAR13343-65.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence is the peptide encoded by the hepatitis C virus (HCV) cDNA insert in clone 5-1-1, 81, 91 and 1-2 (see AAN90304). The polypeptides are used to diagnose HCV-induced NANBH, to raise antibodies for immunoassay or treatment, or to

The peptide may be used in an assay to detect antibodies to HCV and thus to diagnose chronic HCV infection. See also AAR33861-87.

The polypeptides are used to diagnose HCV-induced NANBH, to raise antibodies for immunoassay or treatment, or to produce vaccines.
                                                                                                                                                                                                                 Hepatitis C virus gene - used for prodn. of polynucleotide probes, polypeptide(s) and antibodies for diagnosis, prevention and treatment of infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     It is encoded in the open reading frame of a composite nucleotide sequence derived from overlapping hepatitis C virus (HCV) DNA in clones 81, 1-2, and 91, isolated using a synthetic sequence equivalent to a fragment of HCV cDNA in clone 5-1-1. It is an epitope, portions of which could be used as immunosasay reagents and vaccines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV infection/non-A, non-B hepatitis.

                                                                                                                                It is the polypeptide sequence encoded in the combined open reading frames of the hepatitis C virus (HCV) cDNA of clones 36 and 81. It is not necessarily physically derived from HCV cDNA but may be generated in any manner. Tag a = clone 36. Tag b = clone 81. Tag c = the region of overlap between clones 36 and 81. It is an epitope, portions of which could be used as immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV infection/non-A,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence is used in a novel method for identifying a compound that alters activity of Hepatitis C Virus (HCV) NS4B protein. HCV NS4B modulators can be used as antiviral compounds and as therapeutic agents to treat viruses of the Flaviviridae family, including HCV, yellow fever virus, Dengue viruses types 1-4, and pestiviruses such as bovine viral diarrhoea virus and classic swine fever. Treatment of an HCV-infected human with a HCVI NS4B antagonist, and treatment of an HCV-infected mammal with a HCV NS4B agonist is claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NS4B protein; ATPase; Flaviviridse; antiviral compound; Dengue virus; therapeutic agent; yellow fever virus; pestiviruses; swine fever; bovine viral diarrhoea virus.

Patent No. 6120087

GENERAL INFORMATION:

APPLICANT: Chien, David Y.

APPLICANT: Rutter, William J.

TITLE OF INVENTION: NANBV Diagnostics and Vaccines
NUMBER OF SEQUENCES: 777

CORRESPONDENCE ADDRESS:

ADDRESSED: Chiron Corporation

STREET: 4560 Horton Street

CITY: Emeryville
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: PCT/US92/07813
FILING DATE: 19920916
CLASSIFICATION:
RAME: POREMBSKIP, PRISCILLA E.
REGISTRATION NUMBER: 33,207
REFERENCE/DOCKET NUMBER: 33,207

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                                                  A, Wolecule type: genomic RNA
A, Residues: 1577-1633 - CCH2>
A, Experimental source: solute: solutes genome polyprotein
C; Superfamily: hepatitis C virus genome polyprotein; glycoprotein; hydrolase; nonstructura
C; Keywords: ATP; capsid protein C * status predicted < CPC>
F.116-191/Product: capsid protein M * status predicted < CRE>
F.116-191/Product: major envelope protein B * status predicted < NSI>
F.390-729/Product: nonstructural protein NSI * status predicted < NSI>
F.1307-1237/Region: nucleotide-binding motif A (P-loop)
F.1317/Region: bext motif
F.1316-1319/Region: DEXH motif
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fil616-1862/Product: nonstructural protein NS4a #status predicted <N4A>
Fil863-2013/Product: nonstructural protein NS4b #status predicted <N4B>
Fi.2014-3011/Product: nonstructural protein NS5 #status predicted <NS5>
Fi.2014-3011/Product: nonstructural protein NS5 #status predicted <NS5>

genome polyprotein - hepatitis C virus (strain JT)
N;Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nonstru
protein NS4s; nonstructural protein NS4b; nonstructural protein NS5
C;Species: hepatitis C virus
C;Date: 19-May-2000 #sequence_revision 19-May-2000 #text_change 19-Jan-2001
C;Accession: A45573
R;Tanaka, T.; Rato, N.; Nakagawa, M.; Ootsuyama, Y.; Cho, M.J.; Nakazawa, T.; Hijikat
N;Itle: Molecular cloning of hepatitis C virus genome from a single Japanese carrier
A;Reference number: A45573; MUID:92295714
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A. Experimental source: HCV-JT
A. Note: sequence extracted from NCBI backbone (NCBIN:106206, NCBIP:106207)
C. Superfamily: hepatitis C virus genome polyprotein
C. Superfamily: hepatitis C virus genome polyprotein
C. Superfamily: hepatitis C virus genome polyprotein

A Molecule type: mRNA
A; Residues: 1-3014 < CHA>
A; Cross-references: GB:Y13184
A; Experimental source: genotype 5a, which predominates in South Africa
A; Experimental source: genotype 5a, which predominates in South Africa
A; Experimental source: genotype 5a, which predominates in this paper
C; Superfamily: hepatitis C virus genome polyprotein
F; 2-115, Product: envelope protein M *status predicted < EPM>
F; 116-191/Product: envelope protein M *status predicted < MEE>
F; 384 408/Region: hypervariable *status protein NS1 *status predicted < NS1>
F; 731-1007/Product: nonstructural protein NS2 *status predicted < NS2>
F; 1231-1238/Region: uncleotide-binding motif A (P-loop)
F; 1312-1318/Region: uncleotide-binding motif A (P-loop)
                                                                                                                                                                                                                                                                                                                                                                                   C; Species: hepatitis C virus
C;Date: 19-May-2000 #sequence_revision 19-May-2000 #text_change 19-Jan-2001
C;Accession: JC5620

Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3 4.22-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3 4.21-98); Nonstructural protein NS4A (P4); Nonstructural protein
NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate Japanese) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FIGURE THE SHALL PROTEINS NS2B, NS2B, NS4B AND NS4B ARE

-!- FUNCTION: THE SHALL PROTEINS NS2B, NS2B, NS4B AND NS5 MAY PLAY A FOLE IN THE VIRAL RNA REPLICATION.

-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

-!- SUBUNIT: THE VIRION OF THIS VIRED IS A NUCLEOCAPSID COVERED BY A LIPOPRECIEN ENVELOPEE. THE ENVELOPEE CONSISTS OF TWO PROTEINS:

PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN CAND MARKA.

THOROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

1. TATALYTIC SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

1. NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

1. CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 postition, Cys or Thr in P1 and Ser or Ala in P1.

2. LIPOPROTEIN ENVELOPE. THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:

2. PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

2. SIMILARITY: THE PROTESE BELONGS TO PEPTIDASE FAMILY S29.

Photosystem II 44 kDa reaction center protein (P6 protein) (CP43).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Plant Mol. Biol. Rep. 13:336-342(1995).
-1- FUNCTION: THE 43 kDa PROTEIN (P6) IS A COMPONENT OF THE CORE PHOTOSYSTEM II. IT IS A CHLOROPHYLL BINDING PROTEIN.
-1- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN; CHLOROPLAST THYLAROID MEMBRANE.
-1- SIMILARITY: BELONGS TO THE PSBB / PSBC FAMILY.
                                                 N-LINKED (GLCNAC. . .) (POTENTIAL). F3B364748293A205 CRC64;

Genome polyprotein [Contains: Capsid protein C (Core protein E2
Envelope glycoprotein E1 (GP2) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS5A (P56); Nonstructural protein
NS4B (P57); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               "Elucidation of three putative structural subdomains by comparison of primary structure of Xenopus and human RAP74.";

-!- FUNCTION: NEUROPHYSIN 2 SPECIFICALLY BINDS VASOPRESSIN.
-!- FUNCTION: VASOPRESSIN HAS A DIRECT ANTIDIURETIC ACTION ON THE RIDNEY, IT ALSO GAUSES VASOCONSTRICTION OF THE PERIPHERAL VESSELS.
-!- MISCELLANEOUS: FETAL NEUROPHYSIN IS THE MAJOR NEUROPHYSIN PRESENT IN THE NEUROPHYSIN OF 7 TO 9 MONTH FETUSES & ITS SEQUENCE APPEARS TO BE IDENTICAL WITH THAT OF THE ADULT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PRINTS; PRO0831; NEUROPHYSIN.
